INDEPENDENT APP REVIEW · NOVEMBER 2026

Eggoz Consumer App
UX & Performance Review

A hands-on review of the Eggoz Android app (v1.0.7): what slows it down, where users get stuck, and a prioritised React Native plan to make it faster and easier to order from.

~9 s	47%	20	7
from tapping the icon to home content (3 cold launches)	of frames janky while the hero carousel plays	findings across performance, UX and accessibility	rated high priority, with a fix for each

APP REVIEWED

Eggoz (com.eggozconsumerapp) v1.0.7, build 19
Android 16 · guest mode · Gurugram location · 12 Nov 2026

Independent, unsolicited review of the publicly available app. Not affiliated with or endorsed by Eggoz. Screenshots are of the Eggoz app and are used only to illustrate the findings. No source code was accessed; causes are inferred from measurements and marked as such.

01 · SUMMARY

A strong product held back by its first 10 seconds

The app is built on a modern React Native stack and has great brand content. But the moment a new customer opens it — the launch, the hero carousel, the first scroll — is slow and janky, and the paths to ordering (location, Add, Subscribe, Cart) all have avoidable friction. Most of the fixes are incremental; no rewrite of the backend is needed.

What's working well

- **Modern foundation.** Hermes, Reanimated and react-native-screens are already in place, so improvements can ship screen by screen.
- **Strong brand.** Warm palette, good product photography, recognisable ambassador campaign.
- **Good trust story** on the product page: nutrition facts, local farms, "11 safety checks".
- **Clear value proposition**: daily subscription, morning delivery, coins and wallet rewards.
- **Feed scrolling after load is smooth** (3–4% janky frames), proving the stack can perform.

What's holding it back

- **Slow, janky first impression.** ~9 s to home content; the hero carousel drops ~47% of frames.
- **Loading looks broken.** A blank white screen, then grey boxes and buttons that change size.
- **Location can dead-end.** If location fails, "Try Again" is the only option.
- **Login before anything.** Add, Subscribe, Cart and Profile all require login first.
- **Subscription is hidden** behind an unlabelled calendar icon, and the product page has no sticky Add bar.

Top 6 recommendations

#	RECOMMENDATION	ADDRESSES	EXPECTED RESULT	EFFORT
1	**Rebuild the hero carousel** on the UI thread with display-sized, cached banner images and deferred auto-play.	P1	Smooth first impression; carousel jank under 5%.	Low–Med
2	**Instant home from cache** plus exact-size skeletons; keep the splash until the first render.	P2, P3	Home usable in under 3 s; no blank screen or layout jumps.	Medium
3	**Guest cart**: let people add and subscribe first, and log in at checkout with OTP auto-read.	U3	Fewer drop-offs before the first order.	Medium
4	**Location fallback**: explain before asking, and offer pincode / address search and "browse anyway".	U1, U2	No dead ends on first launch.	Low
5	**Make subscription visible**: labelled "Subscribe & save 5%" buttons and a sticky price / Add / Subscribe bar.	U5, U10, U11	More add-to-carts and subscriptions from the product page.	Low
6	**Image pipeline and virtualised home**: CDN-resized WebP, expo-image caching, FlashList sections.	P1, P4	Lower memory use; smooth first scroll.	Medium

IDs: P = performance finding (pages 4–5), U = UX / accessibility finding (pages 6–9). Effort is indicative and assumes access to the existing codebase.

02 · HOW IT WAS TESTED

Method and measured performance

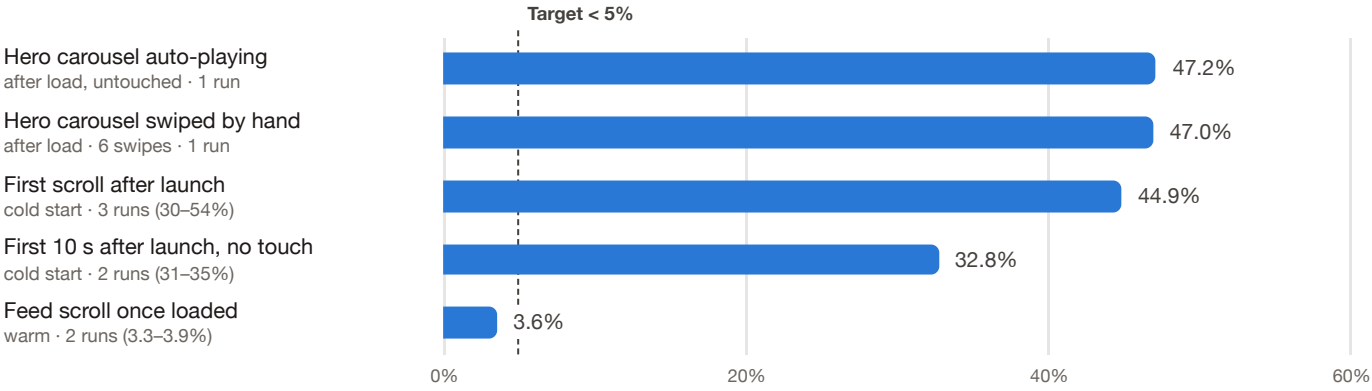

App	com.eggozconsumerapp v1.0.7 (build 19), React Native with Hermes
Device	Android 16 emulator (arm64, single vCPU, 1080 × 2400, 420 dpi) on an Apple-silicon Mac
Session	Guest mode ("Skip"), GPS set to Gurugram
Tools	adb with scripted, repeatable swipes; Android frame statistics (*dumpsys gfxinfo*); UI-hierarchy dumps; pixel-level contrast sampling

How to read the numbers. To look smooth at 60 fps, each frame must be drawn within **16.7 ms**. Android counts a frame as *janky* when it misses that deadline. Lower is better; under 5% generally feels smooth.

Emulator figures are directional. The emulator has a single CPU core, so absolute numbers will be higher than on a real phone. They should be confirmed on a real mid-range Android phone, ideally side by side with the improved build.

Janky frames by scenario (lower is better)

Share of frames that missed the 16.7 ms deadline · average of the runs shown

All measurements

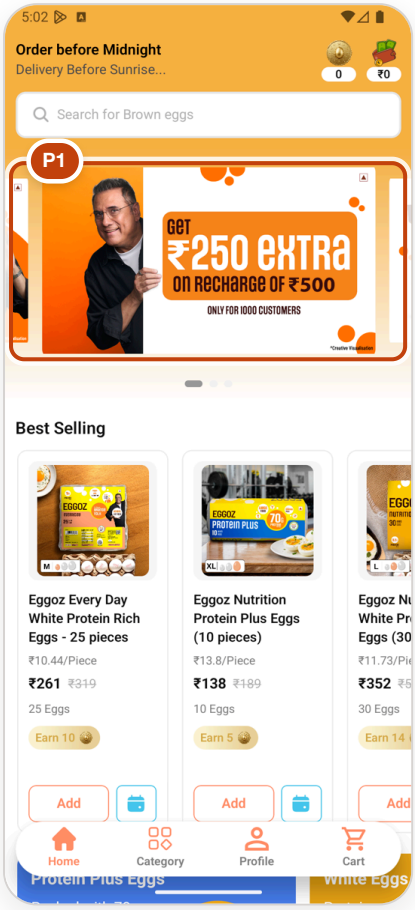

SCENARIO	RUNS	JANKY FRAMES	MEDIAN FRAME	99TH PERCENTILE
Cold launch → home content visible	3	—		8.6 s · 9.6 s · 9.6 s (±1 s)
Hero carousel auto-playing, untouched (after load)	1	47.2%	32 ms	150 ms
Hero carousel, 6 manual swipes (after load)	1	47.0%	32 ms	150 ms
First home scroll right after cold launch	3	29.8–54.3%	27–32 ms	101–300 ms
First 10 s after cold launch, no touch	2	31.1–34.5%	32–38 ms	117–150 ms
Home feed scroll once content has loaded	2	3.3–3.9%	16–20 ms	32–44 ms

Launch time is measured by polling the UI until "Best Selling" is on screen, so it includes the branded splash and has about ±1 s resolution. Runs where a system or login sheet could have been open were discarded.

03 · PERFORMANCE

P1 · High

The hero carousel is the first thing customers see, and the least smooth part of the app

The carousel auto-advances and takes up the most prominent area of home.

What was measured

- With the carousel **auto-playing and untouched**, **47% of frames were janky**. The median frame took 32 ms, which is about 30 fps instead of 60.
- **Swiping it by hand** gave the same result (47% janky), even though the banners had already loaded.
- For comparison, scrolling the product feed once loaded is smooth (3–4% janky). The problem is concentrated in the carousel and in first load, not in the whole app.
- Android's frame statistics show many *slow UI-thread* frames during auto-play (85 of 303) and occasional *slow bitmap uploads*.

Why it matters

The carousel carries the offers ("₹250 extra", "5% off on subscription") and is on screen every time the app opens. A stuttering hero makes the whole app feel slow, even where it isn't.

Likely causes (to confirm with source access)

- The active-slide / dot index is held in React state high in the home tree, so **each auto-advance re-renders the home screen**.
- Banner images are larger than their on-screen size and get decoded or re-uploaded as slides change.
- Looping or peeking slides render extra full-size images during the transition.
- Auto-play starts while the rest of home is still mounting and fetching.

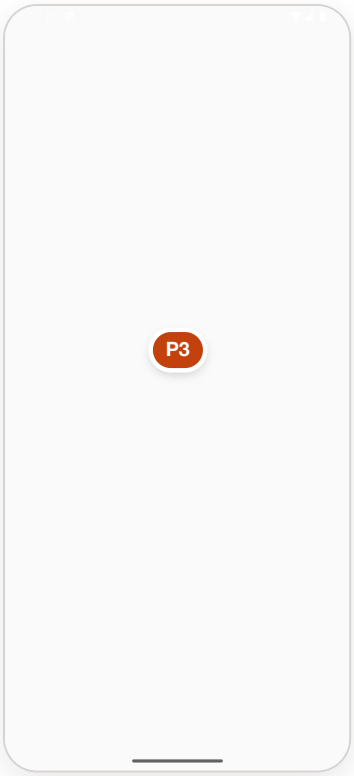

Recommended fix

- Drive the slide position and pagination dots from a **Reanimated shared value**, e.g. react-native-reanimated-carousel or a paged FlatList. That means zero React re-renders per slide.
- Move the carousel into its own **memoised component** so home never re-renders because of it.
- Serve banners at **display size** (about 1080 px wide, WebP/AVIF, under 150 KB) through CDN resizing.
- Render with **expo-image**: memory and disk cache, a blur-hash placeholder, and prefetching of the next slide.
- Start auto-play only **after home's first render**, and pause it when off-screen or when the app is in the background.
- Use a fixed aspect-ratio container so nothing shifts when a banner arrives.

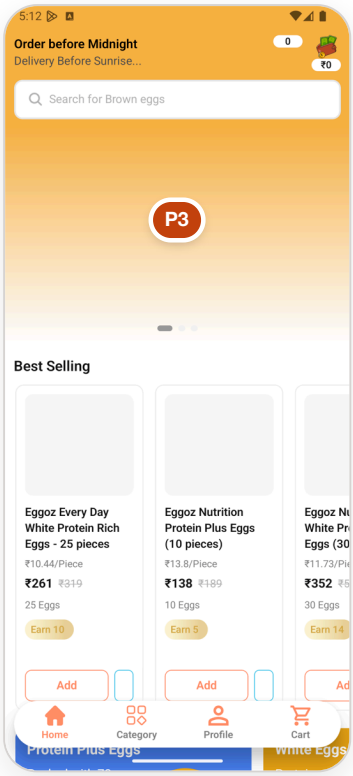

Target: under 5% janky frames and no frame over 100 ms, verified with the same scripted test.

03 · PERFORMANCE

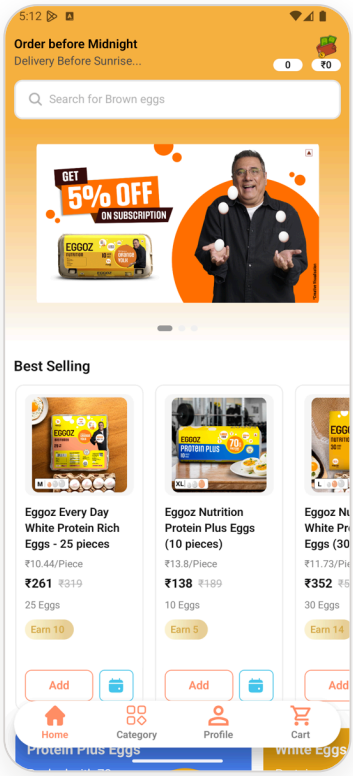

The first 10 seconds: slow launch, blank screen, shifting layout

1. About 4 s after re-opening the app from the launcher: a completely blank white screen.

2. Then: no banner, grey boxes instead of products, and the Add and calendar buttons still changing width.

3. Final layout. Every element moved or appeared between frame 2 and frame 3.

P2 · High **About 9 s from tapping the icon to home content**

Measured at 8.6 s, 9.6 s and 9.6 s across three cold launches, including the branded splash. Google's Android vitals treat a cold start of 5 s or more as excessive.

P3 · High **Blank screen, then content that jumps into place**

There is no skeleton with final dimensions, so images, badges (the coin icon) and buttons appear at different times and push the layout around.

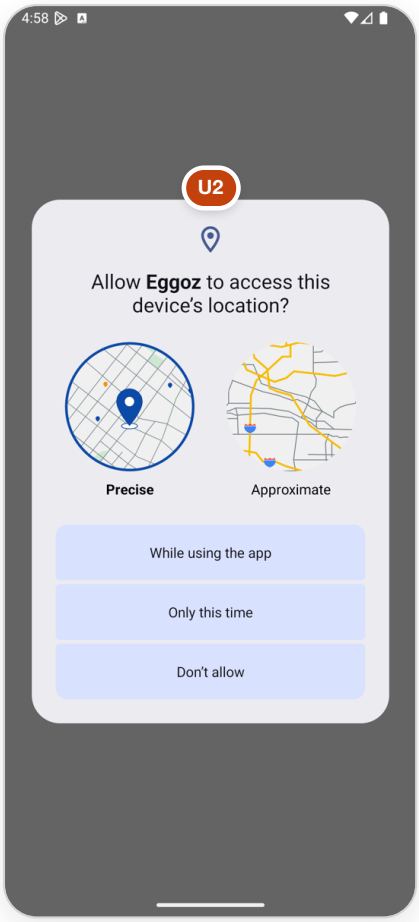

P4 · Medium **The first scroll after launch stutters**

30–54% janky frames on the first scroll, with worst frames of 101–300 ms. The same scroll is smooth (3–4%) once everything has loaded, which points to work happening at mount time: data arriving, images decoding and lists rendering.

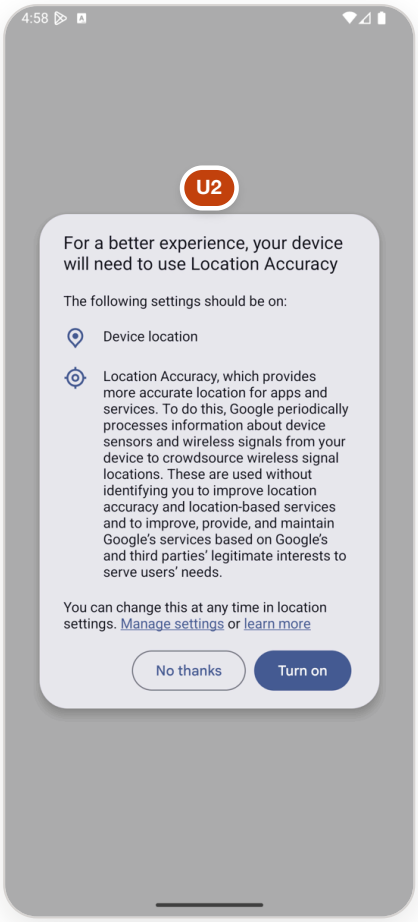

Recommended fix

- **Cache-first home.** Persist the last home response (TanStack Query + MMKV) and render it instantly, then refresh in the background.
- **Keep the native splash** (react-native-bootsplash / expo-splash-screen) until that first render, so there is never a blank white screen.
- **Skeletons with exact final sizes** for banner, cards and badges, so there is zero layout shift.
- **Home as one virtualised FlashList**, with sections as item types and horizontal FlashLists for rails, plus memoised cards.
- **Trim startup.** Lazy-load non-home screens, defer SDK and analytics init, and fetch wallet and coins after first paint.
- **Measure continuously.** Firebase Performance or Sentry traces in production, plus an automated Flashlight / Maestro run in CI.

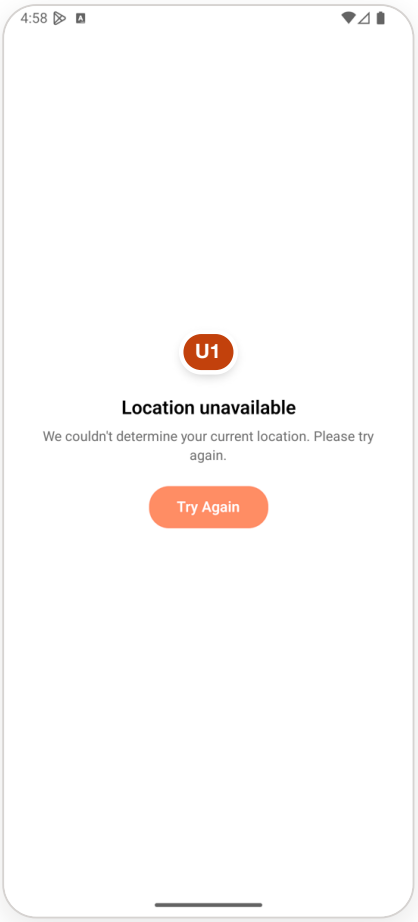

Location: two system dialogs, then a possible dead end

1. The system permission dialog appears straight after "Skip", with no explanation from the app.

2. A second dialog follows, asking the user to turn on Google Location Accuracy.

3. After "No thanks": "Location unavailable", with "Try Again" as the only action.

U1 · High — A location failure blocks the whole app

There is no way to enter a pincode or address, pick a saved address or browse products. Anyone who declines a prompt, is indoors with weak GPS or is ordering for a different address is stuck.

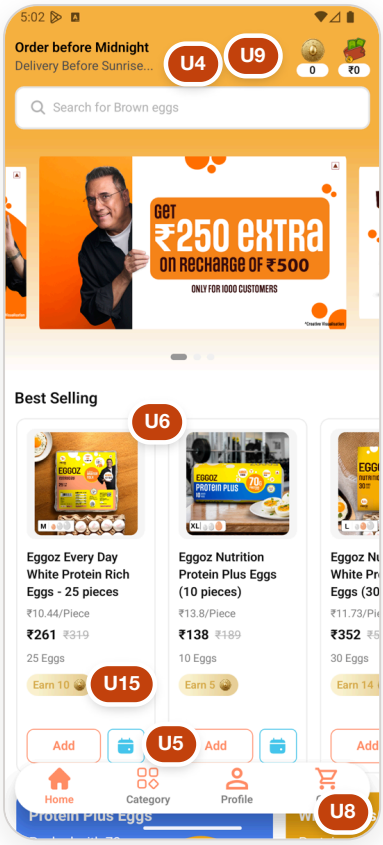

Fix Offer "Enter pincode / search address" (Places autocomplete) and "Browse products", fall back to approximate location, and remember the chosen address.

U2 · Medium — Permission is requested before the user knows why

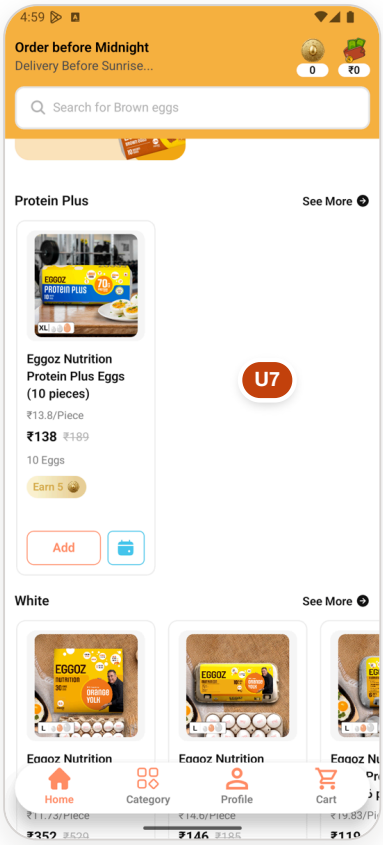

Two system dialogs appear back to back on first use. Unexplained prompts are more likely to be declined, and on Android a second refusal blocks the prompt permanently.

Fix Show a short in-app sheet first ("We use your location to check delivery to your area"), with "Use current location" and "Enter pincode". Only request Location Accuracy if a precise fix actually fails.

Home: the key actions are present but hard to read

Top of home after load.

Further down: the same products repeat, and a one-card row.

U5 · High

Subscription is an unlabelled icon

Subscription is the core of the model, but its entry point is a calendar icon with no text and no screen-reader label.

Fix A text button, "Subscribe · save 5%".

U4 · Medium

No delivery address in the header

The header shows "Order before Midnight" but not *where* you're ordering for, or how to change it.

Fix An address chip: "Delivering to Sector 29, Gurugram ▾".

U6 · Medium

Product cards are very tall

About two products fit per screen, with a large gap between the "Earn" badge and the buttons.

Fix A compact card: image, name, price per egg, and a +/– stepper.

U7 · Low

Repeated products, half-empty rows

The same SKUs appear in Best Selling, Protein Plus and White. Single-product sections leave blank space.

U8 · Low

The floating tab bar covers content

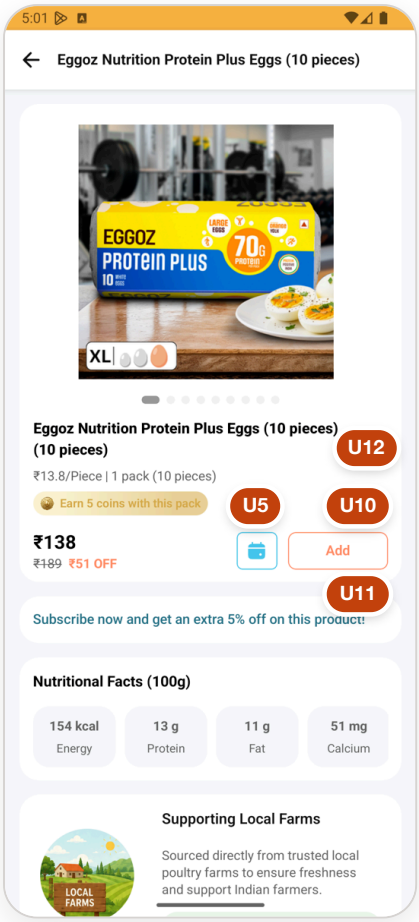

The last row always sits under the tab bar. Add bottom inset padding to the list.

U9 · Low

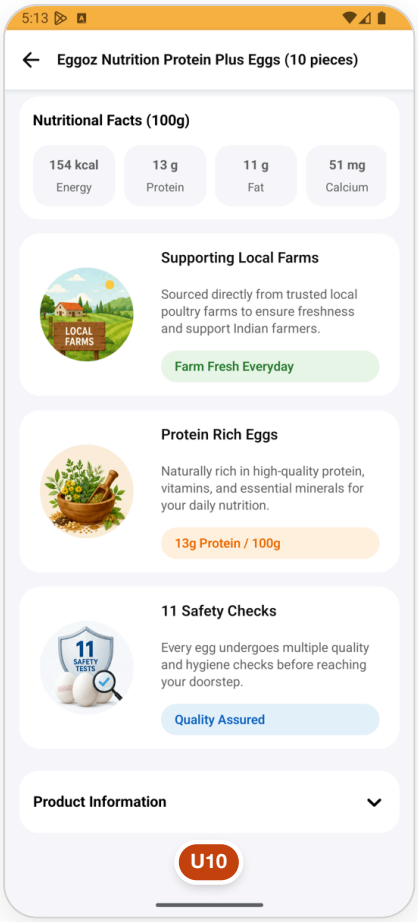

Unexplained "0" and "₹0" badges

It's not clear which badge is coins and which is wallet, and the coin icon sometimes loads late. Label both.

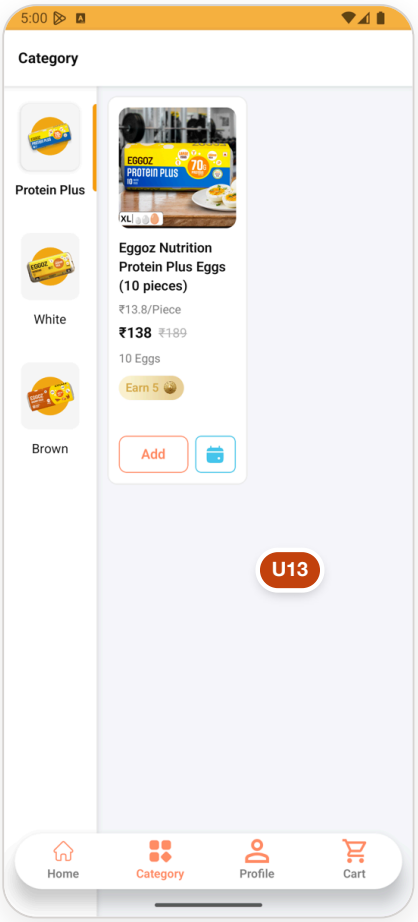

Product page: great content, but the buy button scrolls away

Top of the product page.

After one scroll the price, Add and Subscribe are gone.

Category: one product per category in our session.

U10 · High — No sticky price and Add bar

Most of the page (nutrition, farms, safety checks) is below the fold, and by the time a customer is convinced, the buy button has scrolled away.

Fix A sticky bottom bar with price, a quantity stepper, "Add" and "Subscribe & save 5%".

U11 · Medium — The subscription offer is passive text

"Subscribe now and get an extra 5% off" looks like a banner but does nothing, and the actual subscribe action is the unlabelled calendar icon (U5).

Fix Make it the subscribe button itself, with the delivery frequency picker (daily / alternate days / weekly) inline.

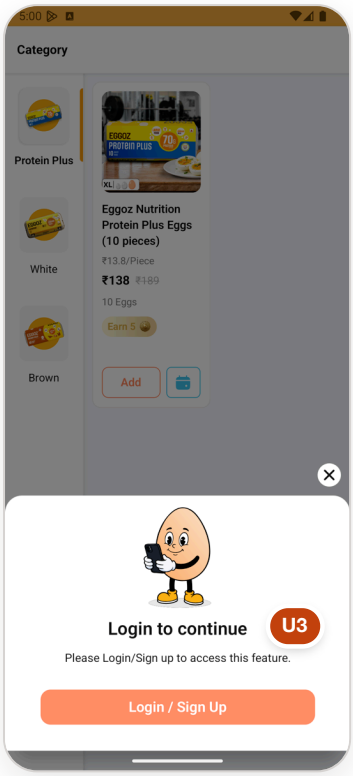

U12 · Low — Duplicated title text

"Eggoz Nutrition Protein Plus Eggs (10 pieces) (10 pieces)": the pack size is appended twice.

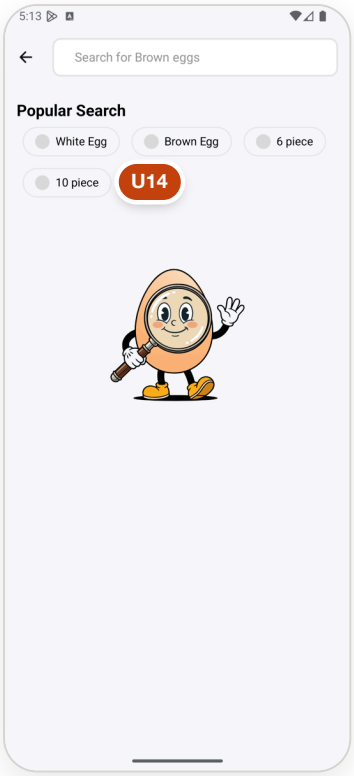

U13 · Low — The category screen is mostly empty

With one product per category, about two-thirds of the screen is blank. Category chips on home, or a pack-size selector (6 / 10 / 25 / 30) on the product page, would serve the same purpose with less navigation.

Guests can browse, but can't start an order

Add, Subscribe, Cart and Profile all open this sheet for guests.

Search: the chip icons are empty grey circles.

U3 · High

Login is required before adding to cart

The app offers "Skip" but then blocks every purchase action. That means asking for a phone number and an OTP at the moment of highest intent, before the customer has even built a cart.

Fix Keep a guest cart on the device, ask for login at checkout, auto-read the OTP (Android SMS Retriever) and offer Phone Number Hint so the number can be filled in one tap.

U14 · Low

Search empty state

The chip icons render as empty circles, and most of the screen is unused.

Fix Show recent searches and best sellers, and give results instantly as the user types.

U16 · Medium

Missing screen-reader labels

5 of the 18 tappable elements on home have no text or label: all three carousel banners and both calendar (subscribe) buttons. TalkBack users can't tell what they do.

Fix Add accessibilityLabel and accessibilityRole to icon buttons and banners.

U15 · Medium

Text contrast is below WCAG AA (4.5 : 1) in 5 of 6 samples

Colours sampled directly from screenshot pixels. The brand orange can stay as a fill colour; it just needs dark text, or a deeper shade wherever text sits on it or in it.

ELEMENT	MEASURED	SUGGESTED CHANGE	NEW RATIO
White text on orange buttons ("Login", "Try Again")	2.28 : 1	#C2410C fill, or #1C1917 text on the current orange	5.18 / 7.66
Orange "Add" label on white	2.28 : 1	#C2410C label and border	5.18
"Earn 10" coin badge text	2.02 : 1	#8A6512 on the same cream badge	4.97
Search placeholder text	2.10 : 1	#767676	4.54
Grey price-per-piece text	3.95 : 1	#6B6B6B	5.33

05 · PLAN

Proposed roadmap and success metrics

Phases are ordered by impact per effort. Durations are indicative for one React Native developer working in the existing codebase.

Phase 1 Weeks 1–2 · Quick wins	Rebuild the hero carousel (P1) · sticky price / Add / Subscribe bar (U10) · labelled "Subscribe & save" buttons (U5, U11) · contrast-safe colour tokens and accessibility labels (U15, U16) · delivery-address chip (U4) · tab-bar inset, title fix, badge labels (U8, U9, U12).
Phase 2 Weeks 3–5 · Speed	Cache-first home and native splash until first render (P2) · exact-size skeletons (P3) · image pipeline: CDN-resized WebP and expo-image (P1, P4) · home as one virtualised FlashList (P4) · startup trimming · production performance monitoring and a CI performance test.
Phase 3 Weeks 6–8 · Conversion	Pre-permission sheet and location fallback with pincode / address search (U1, U2) · guest cart with login at checkout and OTP auto-read (U3) · compact product cards and de-duplicated sections (U6, U7) · pack-size selector and category rethink (U13) · search empty state (U14).

How success is measured

METRIC	TODAY (MEASURED)	TARGET
Cold launch → home content usable	8.6–9.6 s	< 3 s
Janky frames while the hero carousel plays	47%	< 5%
Janky frames on the first scroll after launch	30–54%	< 5%
Worst frame during carousel and first scroll	150–300 ms	< 100 ms
Blank white screen while opening	Seen	Never
Sampled text elements failing WCAG AA contrast	5 of 6	0
Guest can add to cart and see a total	No	Yes
Location failure has a manual path	No	Yes

Every "today" figure was produced by repeatable adb scripts. The same scripts run against the improved build give a like-for-like before/after.

Next step

I'm happy to show this in practice: a working React Native prototype of the redesigned **Home** (with the new hero carousel), **Product** and **Cart** screens. It would be measured with the same test scripts so the improvement is visible in numbers, and it would run on your phones through Expo.
